

**WEB-BASED EVENT MANAGEMENT SYSTEM WITH
COMMUNITY FORUM FOR CITY MAYOR'S
OFFICE MUSLIM CONCERNS AND
AFFAIRS DIVISION**

**A Capstone Project Proposal
Presented to the Faculty of the
Information and Communications Technology Program
STI College - General Santos, Inc.**

**In Partial Fulfilment
of the Requirements for the Degree
Bachelor of Science in Information Technology**

**Ashley Jan M. Aso
John Carlos Kozel A. Carcillar
Neil Amos C. Cloa
Josh Angelu Seanville L. Reyes**

May 23, 2026

ENDORSEMENT FORM FOR PROPOSAL DEFENSE

TITLE OF RESEARCH: Web-Based Event Management System with
Community Forum For City Mayor's Office
Muslim Concerns and Affairs Division.

NAME OF PROPONENTS: Ashley Jan Aso
John Carlos Kozel A. Carcillar
Neil Amos C. Cloa
Josh Angelu Seanville L. Reyes

In Partial Fulfilment of the Requirements
for the Bachelor of Science degree in Information Technology
has been examined and is recommended for Proposal Defense.

ENDORSED BY:

Benhar L. Masahod, LPT
Capstone Project Adviser

APPROVED FOR PROPOSAL DEFENSE:

Jolina Migrino, LPT
Capstone Project Coordinator

Jhon Dell B. Aristales
Capstone Project Coordinator

NOTED BY:

Anthony Mark Silong, MIT
Program Head

May 23, 2026

APPROVAL SHEET

This capstone project proposal titled **Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division** prepared and submitted by **Ashley Jan Aso, John Carlos Kozel A. Carcillar, Neil Amos Cloa, and Josh Angelu Seanville Reyes**, in partial fulfillment of the requirements for the degree of Bachelor of Science in Information Technology, has been examined and is recommended for acceptance and approval.

Benhar L. Masahod, LPT
Capstone Project Adviser

Accepted and approved by the Capstone Project Review Panel
in partial fulfillment of the requirements for the degree of
Bachelor of Science in Information Technology

Nur Ali Padasan, MIT, LPT
Panel Member

Dan Henly P. Sales
Panel Member

Anthony Mark F. Silong, MIT
Lead Panelist

Noted:

Jolina M. Migrino, LPT
Capstone Project Coordinator

Anthony Mark F. Silong, MIT
Program Head

INTRODUCTION

Project Context

Across the world, religious communities continue to organize large-scale faith-based programs that require strong coordination, timely announcements, and effective resource management. Major religious observances such as Ramadan, Easter, and Diwali involve a wide range of activities including prayer schedules, charity distributions, gatherings, and community-based events (Mohammed et al., 2023). These activities often require coordination among religious leaders, volunteers, donors, and local organizations. As communities grow larger, organizing these programs becomes more complex, especially when multiple events occur simultaneously in different locations.

Globally, many communities have shifted toward the use of web-based event management systems to reduce manual workload and improve planning efficiency. Digital systems allow organizations to schedule events, send real-time announcements, track attendance, and monitor donation distributions (Sukmandhani et al., 2022). Studies show that web-based platforms enhance engagement and coordination by providing a centralized space for communication and documentation. Garcia and Santos (2021) emphasized that interactive web-based systems improve stakeholder participation by allowing organized planning and efficient service delivery. This global trend highlights the increasing importance of digital solutions in managing community programs (Kukartsev et al., 2023).

In the Philippines, the growing adoption of digital platforms has become evident across government agencies, institutions, and community organizations. The Department of Trade and Industry (DTI, 2022) emphasized that digital transformation is increasingly being adopted to streamline organizational processes, improve service delivery, and reduce inefficiencies caused by manual operations. As more Filipino communities become connected through internet access and mobile technology, digital systems have become a practical solution for coordination and public service management (Torres & Bautista, 2024).

In Muslim communities across Mindanao and other parts of the Philippines, Ramadan remains one of the most important religious seasons. It involves daily fasting, prayer, charity activities, and community gatherings. According to the National

Commission on Muslim Filipinos (NCMF, 2022), Muslim communities in Mindanao continue to increase in population and organizational complexity, creating a stronger need for structured coordination and organized management during major Islamic observances. Despite this growth, many communities still rely on informal and manual approaches in managing Ramadan programs, resulting in operational challenges and limited documentation (Aldrin et al., 2024).

In General Santos City, the Muslim community actively observes Ramadan through various barangay and mosque-level programs such as Iftar gatherings, Taraweeh prayer schedules, charity distributions, religious announcements, and coordination with local government units. These programs involve multiple stakeholders including barangay officials, Imams, community leaders, donors, and residents. However, despite the increasing number of activities, the management of Ramadan programs remains largely dependent on manual processes (Ramos et al., 2024).

Based on gathered data, barangays and Muslim organizations in General Santos City commonly use paper-based scheduling, verbal announcements, social media postings, and messaging applications to coordinate events. Attendance is recorded manually, and donation and distribution records are often written informally without standardized monitoring (Khan et al., 2025). While these methods allow basic communication, they often result in schedule conflicts, delayed announcements, incomplete documentation, and difficulties in tracking donations and distributions. These challenges affect the efficiency and transparency of program implementation, especially when multiple events occur within the same time period.

The lack of a centralized platform limits accessibility for elderly participants and residents in remote areas who may not consistently receive online announcements or informal updates. The absence of an organized system also makes it difficult for barangay officials and community leaders to monitor event status, confirm attendance, and produce accurate reports for evaluation and planning (Kumar & Priya, 2025). These local challenges emphasize the need for a centralized web-based event management system that can improve scheduling, communication, monitoring, and documentation of Ramadan-related programs in General Santos City.

Purpose and Description

The purpose of the proposed system is to provide a centralized and structured digital platform that improves the management, coordination, and documentation of Ramadan-related community activities. The system is designed to enhance collaboration among LGU/Barangay Admins, Imams/Mosque Administrators, Community Leaders, and Community Viewers by integrating scheduling, notification, monitoring, and reporting functionalities into a single web-based application. It aims to reduce reliance on manual processes, improve information accuracy, and streamline communication among stakeholders.

The system enables authorized users to create and manage event schedules, including assigned venues, organizers, and time details, with a calendar view for better visualization. It includes an announcement and notification module for posting updates and sending alerts to stakeholders. Community leaders and Imams can input prayer schedules, mosque events, and charitable activities for centralized documentation.

Additionally, the system provides activity monitoring and attendance tracking features to record participation and track event status. A resource and donation management module supports the recording of donations and distributions, ensuring transparency. The system also generates printable reports, including event schedules, attendance summaries, and donation records.

Overall, the system enhances service delivery by improving organization, communication, and transparency. By utilizing web-based technologies accessible through internet-connected devices, the system promotes accessibility and efficiency, leading to improved coordination and community engagement during the Ramadan season.

Objectives

To design and develop Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division., a web-based scheduling, notification, and activity monitoring system that will improve the coordination, communication, and documentation of Ramadan season programs and community services in General Santos City.

Specific Objectives

1. To Develop a web-based event management system with role-based access for LGU/Barangay Admin, Imam/Mosque Administrator, Community Leader, and Community Viewer, ensuring secure and centralized management of Ramadan programs.
2. To Design and implement an integrated scheduling, announcement, and notification module that supports efficient event planning, real-time information dissemination, and coordinated communication among stakeholders.
3. To Develop an activity monitoring, attendance tracking, and resource management module that records event participation, tracks event status, and documents donations and distributions for transparent program management.
4. To Generate automated, printable, and exportable reports, including event schedules, attendance summaries, and donation records, to support evaluation and decision-making by barangay officials.

Scope and Limitations

The scope of the project covers the development of Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division. The system is designed to improve program scheduling, announcement dissemination, activity monitoring, and donation tracking for Ramadan-related community programs. The System aims to enhance coordination, communication, and transparency among its four primary users: LGU/Barangay Admin, Imam/Mosque Administrator, Community Leader, and Community Viewer. By integrating these modules into a single centralized platform, the system minimizes reliance on manual and informal tools, improves data organization, and ensures a more efficient workflow for Ramadan program management.

The following were the scopes of the project:

1. User Management Module

The system supports four user roles with role-based access control:

LGU/Barangay Admin – manages the entire system, approves accounts, and generates reports.

Imam/Mosque Administrator – inputs prayer schedules and mosque-related events.

Community Leader – submits and monitors community Ramadan activities.

Community Viewer – views published announcements and schedules.

2. Ramadan Program and Activity Scheduling Module

Create, edit, and delete Ramadan events such as Iftar programs, Taraweeh schedules, and charity drives.

Assign event details including title, date and time, venue, organizer, and description.

Calendar view and list view for event schedules.

Event status tracking categorized as upcoming, ongoing, or completed.

3. Announcement and Notification Module

Post official announcements categorized as prayer schedules, event reminders, charity drive updates, or community advisories.

System notification alerts for registered users.

Optional email notification feature for stakeholder dissemination.

4. *Activity Monitoring and Attendance Tracking Module*

Attendance list input per event.

Event monitoring dashboard showing event status and participation statistics.

Generate simple event monitoring reports.

5. *Resource and Donation Management Module*

Record donations received including donor name (optional), donation type (cash, food, or supplies), amount or quantity, and date received.

Record distribution logs including beneficiary, items distributed, and date.

Donation and distribution summary dashboard.

6. *Report Generation Module*

Generate and export printable reports including Ramadan event schedule reports, attendance summaries, and donation and distribution records.

Export options via PDF or browser print function.

7. *Dashboard and Analytics*

Summary dashboard showing total number of events, upcoming events, attendance totals, and donation totals.

The limitations of the study are as follows:

1. System Access Limitation: Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division. is a web-based application and requires a stable internet connection and a compatible web browser. Offline functionality is not supported.

2. **Mobile Application Limitation:** The system is web-only and mobile-responsive but does not include a dedicated Android or iOS mobile application.
3. **Notification Limitation:** Real-time SMS gateway integration is not included unless a free API is available during development. Notifications are limited to in-system alerts and optional email notifications.
4. **Attendance Tracking Limitation:** Biometric attendance tracking and QR code scanning are not included in the base scope and are considered optional features subject to time availability.
5. **Islamic Calendar Limitation:** Automated Islamic calendar computation is not included. All event dates and schedules are entered manually by the authorized administrator.
6. **Payment Processing Limitation:** The system does not support online payment processing for donations. All donation records are manually entered by authorized users.
7. **Data Accuracy Limitation:** The accuracy of event schedules, attendance records, and donation logs is dependent on correct and timely input from authorized users. Incorrect data entry may affect the reliability of generated reports.

Review of Related Literature/Studies/Systems

In today's digital environment, community-based organizations and local government units increasingly rely on web-based systems to automate operations, improve service coordination, and enhance stakeholder engagement. The transition from manual processes to digital platforms has been shown to significantly reduce operational delays and improve accuracy in program management. Community programs, particularly those tied to cultural and religious observances, require structured and timely coordination that informal tools such as chat applications and paper-based records cannot reliably provide.

Sukmandhani et al. (2022) developed a dashboard-based web application for service management operations that integrates report accommodation and task administration into a centralized platform, achieving an 84% user acceptance rate and streamlining business and service management processes. This supports the feasibility of a centralized web-based approach for community program management such as that proposed by the Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division.

Similarly, Kukartsev et al. (2023) demonstrated that automated information systems can optimize management by automating requests, monitoring quality, and generating operational reports. These principles are directly applicable to the scheduling and monitoring requirements of Ramadan community programs where accuracy and timeliness are critical.

Regarding scheduling and notification systems, web-based platforms have proven effective in improving the dissemination of timely information to stakeholders. Alhambra and Parcerro (2020) demonstrated that an online appointment and notification system implemented in a healthcare setting significantly reduced delays in information delivery and improved coordination among staff and clients. The study highlights that centralized scheduling systems can be adapted across different sectors, including community-based program management.

Ampuan and Delena (2023) further developed a web-based appointment and notification system for university offices in the Philippines, finding that automated notification features reduced missed appointments and improved user satisfaction. These findings support the inclusion of a notification module in the proposed system to ensure timely dissemination of Ramadan program updates to community members and barangay stakeholders.

In the context of activity monitoring and attendance tracking, web-based monitoring systems have demonstrated their capacity to support transparent and accountable program documentation. Frevizola and Irfan (2025) developed a web-based work progress monitoring system that is accessible across various devices, supports efficient data updates, and enhances coordination among technical disciplines within the project. Their findings confirm the effectiveness of web-based monitoring in tracking event participation and program status.

Shree (2025) proposed an advanced real-time monitoring dashboard that incorporates role-based access control and streamlined data visualization, enhancing collaboration among teams and minimizing manual errors. These features are consistent with the activity monitoring and attendance tracking module proposed for the system. For resource and donation management, transparent and accountable record-keeping is essential for community trust and program sustainability. Cabubas et al. (2025) developed a Customer Feedback Management System that integrates multi-channel data collection and real-time analysis dashboards, significantly enhancing processing efficiency and data-driven decision-making. The data management principles applied in their study are applicable to the donation and distribution tracking objectives of the proposed system.

Praise et al. (2024) found that effective use of documented records enables organizations to identify service gaps and improve operational efficiency. In the context of Ramadan resource management, systematic documentation of donations and distributions can support barangay officials in evaluating program impact and planning

future charitable activities.

Role-Based Access Control (RBAC) is widely used in web-based systems to ensure secure and organized access to system functionalities. Samonte et al. (2024) emphasized the necessity for tailored RBAC models that streamline access control by aligning privileges with organizational responsibilities, recommending hierarchical structures that reflect real-world organizational roles. This is directly relevant to the proposed system's multi-role user structure involving administrators, Imams, community leaders, and community viewers.

Manoj et al. (2025) further confirmed that implementing RBAC with secure authentication significantly reduces insider threats and supports regulatory compliance. Their findings reinforce the importance of controlled access and role-based permissions in the proposed system, particularly given the sensitive nature of community donation records and event documentation.

Regarding report generation, the ability to produce printable and exportable summaries from system data is a critical feature for community and barangay program evaluation. Abraham et al. (2025) developed a web application that uses real-time data and project parameters to generate accurate summary reports, with responsive design and structured data storage ensuring accessibility. Their approach supports the feasibility of including printable report generation in the proposed system.

Rehiara et al. (2025) also demonstrated that web-based reporting platforms significantly reduce processing time, improve calculation accuracy, and simplify documentation revisions compared to traditional manual methods. These findings directly support the report generation module proposed for the system, which aims to replace manual report preparation with automated, print-ready outputs.

In terms of system usability and evaluation, Wilson and Price (2024) emphasized that responsive web design and accessibility-first development improve overall user

experience and ensure wider audience reach, particularly for users accessing systems on mobile devices. This is consistent with the proposed system's design requirement for a mobile-responsive, browser-accessible interface that does not require software installation.

Internationally, one of the widely used event management platforms is Eventbrite, a web-based system that allows users to create events, publish schedules, manage registration, and track attendance through digital tools. Eventbrite provides centralized event coordination through online event posting, ticketing or registration modules, automated email notifications, and analytics reporting. Although Eventbrite is designed for general public events and commercial use, its features demonstrate how web-based systems can effectively streamline event organization, communication, and participant monitoring. The platform reflects the global trend of using centralized web-based solutions to improve coordination and reduce manual workloads, which is relevant to the development of a specialized Ramadan community event management system.

Locally, government agencies in the Philippines have also adopted centralized systems for scheduling and public announcements. A relevant example is the Philippine Government's eGov PH platform, which integrates public services and provides a centralized digital channel for accessing government programs and announcements. While the eGov PH platform is broader in scope and not focused on community religious events, it demonstrates the Philippine government's push toward digital governance and centralized platforms for service coordination. The adoption of such systems supports the feasibility of developing a localized web-based platform for managing community programs such as Ramadan schedules, announcements, and donation activities.

In addition, many Local Government Units (LGUs) and barangays in the Philippines rely on **Facebook Pages and Messenger-based communication systems** for event announcements, coordination, and public updates. These platforms serve as informal community management systems where residents receive schedules and announcements. These tools lack structured modules for attendance tracking, donation

recording, reporting, and centralized scheduling, which often leads to incomplete documentation and unorganized program monitoring. This highlights the need for a dedicated web-based system that provides formalized features specifically designed for Ramadan program management in General Santos City.

A study by Aldrin et al. (2024) developed a cloud-based community information management platform designed for barangay-level governance and public service coordination. The researchers found that centralized digital record systems improved communication efficiency, minimized redundant data encoding, and enhanced transparency in public transactions. Their findings support the proposed system's objective of centralizing Ramadan event schedules, attendance records, and donation documentation into a unified digital platform.

According to Mohammed et al. (2023), web-based community engagement systems significantly improve participation in religious and cultural programs by providing accessible online announcements, discussion forums, and real-time updates. Their study emphasized that Muslim community organizations benefit from structured online coordination tools that encourage broader stakeholder participation. This supports the inclusion of the community forum and announcement modules in the proposed Ramadan event management system.

Ramos et al. (2024) conducted research on a responsive web-based monitoring and reporting system for local outreach programs. The study revealed that automated report generation and centralized monitoring reduced administrative workload and improved data accuracy among local coordinators. Their findings validate the proposed system's report generation and attendance tracking modules intended for barangay-level Ramadan activities.

A study by Kumar and Priya et al. (2025) highlighted the effectiveness of multi-level authentication and Role-Based Access Control (RBAC) in safeguarding sensitive organizational records in community-based information systems. The researchers

concluded that restricting access based on user responsibilities minimizes unauthorized data manipulation and improves accountability. These findings directly support the proposed system's implementation of hierarchical user roles for administrators, Imams, barangay coordinators, and community members.

Research conducted by Torres and Bautista et al. (2024) examined the impact of mobile-responsive government web portals on citizen engagement in local programs. Their findings showed that responsive systems increased accessibility for users relying on smartphones and improved participation rates in community activities. This supports the proposed system's requirement for a browser-accessible and mobile-responsive interface to ensure accessibility among residents and stakeholders in General Santos City.

Furthermore, Khan et al. (2025) developed a web-based donation tracking and inventory management system for nonprofit organizations. Their study demonstrated that digital tracking systems improved transparency, minimized record inconsistencies, and strengthened donor confidence through real-time monitoring and automated reporting. These findings are highly relevant to the proposed system's donation and resource distribution module intended to support Ramadan charitable programs and community outreach initiatives.

Synthesis / Research Gap

Existing systems demonstrate the capabilities of web-based platforms in managing community activities but also reveal important limitations. Many current platforms focus on either scheduling, notification, or monitoring in isolation, without integrating these functions into a unified system. Additionally, most available systems are designed for general administrative or commercial use and do not address the specific cultural and religious coordination requirements of Ramadan community programs. This gap highlights the need for a purpose-built and integrated platform that combines scheduling, announcements, monitoring, attendance tracking, and donation documentation in a single accessible system.

METHODOLOGY

This chapter presents the methodology used in the development of the Web-Based Event Management System with Community Forum for the City Mayor's Office Muslim Concerns and Affairs Division in General Santos City. It discusses the research and development approach applied in designing, developing, and evaluating the proposed system. The methodology outlines the processes of requirements gathering, system planning, design, implementation, and testing to ensure that the system effectively addresses the challenges in managing Ramadan community programs. This methodology ensured that the system meets the functional requirements of barangay officials, Imams, community leaders, and community members, while maintaining usability, accessibility, and reliability.

Figure 1: Agile-Kanban Methodology Mode

The methodology used in developing the proposed system focuses on creating a user-centered, efficient, and scalable web application. The system is designed to improve scheduling, announcement dissemination, activity monitoring, and donation tracking for Ramadan community programs in General Santos City.

To achieve this, the researchers adopted the Agile Kanban methodology, which

supports continuous development, flexibility, and adaptation to changing user requirements. This approach allows the team to develop the system in manageable tasks while continuously testing and improving each feature. Key components such as event scheduling, notification management, attendance tracking, and donation recording were developed iteratively to ensure functionality, usability, and reliability.

The development process began with a planning phase, where functional and non-functional requirements were identified through interviews and consultations with barangay staff, Imams, and community leaders. Functional requirements included event management, announcement posting, attendance tracking, donation recording, and report generation, while non-functional requirements focused on usability, performance, and security.

A Kanban board was used to manage tasks, categorized into “To Do,” “In Progress,” and “Done,” allowing the team to monitor progress and address issues efficiently. Continuous testing and user feedback were incorporated throughout development to ensure that the system meets user needs and operates effectively.

Agile Kanban was chosen for this project because it provides a visual, flexible, and efficient framework for managing software development. The system was developed in stages across the four main user modules — Barangay Admin, Imam, Community Leader, and Community Viewer — while continuously integrating feedback into the workflow. The use of a Kanban board enabled the team to track tasks, monitor progress, and manage priorities effectively, ensuring that development stayed aligned with project objectives and timelines. Through this approach, the system remained iterative and adaptable, allowing continuous improvement of features such as event scheduling, notification delivery, activity monitoring, and report generation.

The development process began with a comprehensive planning phase, where the researchers identified and analyzed both functional and non-functional requirements of the system through interviews and consultations with barangay staff, Imams, and community leaders. Functional requirements included event creation and management,

announcement posting, attendance recording, donation logging, and report generation, while non-functional requirements focused on usability, system performance, and data security. These requirements were translated into detailed user stories that reflected the needs of all user roles. Each user story was then divided into smaller, actionable tasks to ensure clarity and efficient implementation.

Following the planning stage, a Kanban board was established as the main tool for visualizing the development workflow. The board was organized into columns such as To Do, In Progress, and Done, with each task represented by a card that moved across these stages as work progressed. This setup allowed the team to clearly monitor task status, track overall development progress, and quickly identify delays or bottlenecks. It also improved transparency and accountability, as all team members had real-time visibility of the project workflow.

During the execution phase, the team adopted a pull-based approach by selecting tasks from the To Do column based on priority and team capacity. Developers worked collaboratively to implement system features, including the Admin module for system and user management, the scheduling and notification modules for event coordination, and the monitoring and donation modules for activity tracking and resource documentation. Continuous integration and testing were conducted to ensure that each feature functioned correctly and met the defined acceptance criteria.

After completing development tasks, the system underwent testing and evaluation to validate its functionality, performance, and usability. The researchers simulated real-world Ramadan program management scenarios by acting as Barangay Admins, Imams, and Community Leaders to test the system's full workflow. Admins tested user management, event scheduling, announcement posting, and report generation. Community leaders tested attendance recording and donation entry, while Imams tested prayer schedule input and event monitoring. Tasks that passed testing were marked as completed and moved to the Done column.

User feedback was gathered through system demonstrations and evaluations, which played a crucial role in refining the platform. Barangay staff found the centralized

scheduling and notification features helpful in improving coordination. Community leaders appreciated the donation tracking and report generation capabilities, while Imams valued the organized schedule management for prayer times and mosque events. Suggestions for improvement were incorporated into subsequent development cycles through the updated product backlog.

Finally, the team engaged in continuous improvement through regular evaluation and retrospective activities to identify strengths, weaknesses, and possible enhancements. The product backlog was continuously updated to incorporate new features, improvements, and user feedback, ensuring that the system remained relevant, efficient, and user-friendly throughout the development process.

Technical Background

Technologies to be Used

Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division was developed using standard and widely adopted web technologies to ensure accessibility, reliability, and ease of deployment. The frontend of the system was created using HTML, CSS, and JavaScript, which are essential technologies for building interactive and responsive web applications. HTML was used to structure the web pages, CSS was applied to design and enhance the visual presentation, and JavaScript was utilized to implement dynamic features and improve user interaction. The development environment used was Visual Studio Code (VS Code), which provided a flexible and efficient platform for coding, debugging, and managing project files.

On the back-end, the system was developed using PHP, a server-side scripting language that enables the processing of user requests, handling of business logic, and communication with the database. PHP was used to manage core system functionalities such as user authentication, event scheduling logic, announcement posting, attendance

recording, donation entry management, and report generation. This allowed the system to dynamically generate content and respond to user actions in real time.

For data storage and management, the system utilized MySQL, a relational database management system known for its reliability and efficiency. MySQL was used to store and organize important system data including user accounts, event schedules, attendance records, donation logs, distribution records, and announcement content. The integration of PHP and MySQL enabled efficient data retrieval, updating, and management, ensuring data consistency and system reliability throughout the Ramadan program period.

The system also incorporates responsive web design principles to ensure accessibility across desktop and mobile devices, which is particularly important for community users who primarily access digital platforms through smartphones. Each user role was provided with a role-based dashboard designed to support their specific tasks, such as system management for the Barangay Admin, event input for the Imam, activity coordination for the Community Leader, and announcement viewing for the Community Viewer.

Overall, the combination of HTML, CSS, JavaScript, PHP, and MySQL provides a stable, cost-effective, and scalable solution for developing the proposed web-based system. This technology stack supports efficient system performance, secure data handling, and a user-friendly interface, ensuring that the platform effectively meets the needs of all user roles during the Ramadan season.

Calendar of Activities

The Calendar of Activities outlines the schedule of tasks involved in the development of the Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division. It serves as a timeline that guides the project's progression, ensuring that each phase, from planning to deployment, is executed in an organized and timely manner.

System Requirements

The table below presents the minimum software and hardware requirements necessary for the development and deployment of Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division.

Category	Requirements
Operating System	Windows
Web Browser	Google Chrome, Microsoft Edge
Frontend Technology	HTML, CSS, JavaScript
Backend Technology	PHP
Database	MySQL
Development Tools	Visual Studio Code
Notification Integration	Email-based (PHPMailer or similar)

Table 2. Software Requirements

Category	Requirements
Processor	Intel Core i3 or higher
RAM	Minimum 4 GB
Storage	At least 256 GB HDD/SSD
Display	Monitor with at least 1366x768 resolution
Network	Stable internet connection
Input Devices	Keyboard and Mouse
Deployment	Cloud-based or local server

Table 3. Hardware Requirements

Requirements

In the initial phase of system development, comprehensive planning, data gathering, and analysis were conducted to determine the system requirements and prepare formal documentation. This phase serves as the foundation of the Software Development Life Cycle (SDLC), ensuring that the proposed system effectively addresses user needs and operational challenges.

Requirements Analysis

The requirements analysis was conducted through interviews and consultations with key stakeholders, including barangay personnel, Imams, and community leaders. Findings revealed that event scheduling, coordination, and communication are currently managed through informal and manual methods such as messaging applications, social media, and paper-based records.

Attendance tracking and reporting are performed manually, while donation and distribution records lack standardization and centralization. Respondents also identified several challenges, including difficulty in confirming attendance, inefficient coordination, limited data accessibility, and usability concerns for elderly users and individuals in remote areas. These findings highlight the need for a centralized, web-based system that enhances accessibility, improves communication, supports attendance confirmation, and ensures efficient and organized documentation of community activities.

WHO: The People Involved

1. LGU/Barangay Administrator

Responsible for overall system management, including user account administration, event scheduling approval, announcement posting, and report generation.

2. Imam / Mosque Administrator

Manages prayer schedules and mosque-related activities, and validates religious announcements to ensure accuracy and alignment with community practices.

3. Community Leader / Organizer

Organizes and submits community activities, records attendance, manages donation and distribution entries, and monitors activity status.

4. Community Viewer (Residents)

Accesses event schedules, announcements, and updates. This role is limited to viewing information without modification privileges.

WHAT: The Business Activity

The system is designed to streamline the management of Ramadan community programs through a centralized digital platform. It replaces manual and fragmented processes with an integrated solution that supports:

- Online event scheduling and management
- Announcement dissemination and notifications
- Attendance tracking and monitoring
- Donation and distribution recording
- Report generation and data management

WHERE: The Environment

The system operates in both development and production environments:

- Development Environment:
Developed using Visual Studio Code and tested locally through XAMPP (Apache, PHP, MySQL).

- **Production Environment:**
Deployed on a web hosting platform, ensuring system availability, security, and accessibility via internet-enabled devices. Users can access the system through standard web browsers, ensuring cross-device compatibility and responsive design.

WHEN: The Timing

- **User Access:** The system is available 24/7, allowing users to access schedules, announcements, and reports anytime.
- **Administrative Access:** Administrators and authorized users manage system operations during working hours or as needed.
- **System Processes:** Notifications, updates, and data recording occur in real time or immediately after user actions.

Functional Requirements

The system shall provide the following functionalities:

1. User Management

The system shall allow Barangay Admin to create, update, activate, suspend, and manage user accounts. The system shall enforce secure authentication and role-based access control.

2. Event Scheduling

The system shall allow authorized users to create, edit, and manage event schedules. The system shall display events in both calendar and list views. The system shall categorize events as upcoming, ongoing, or completed.

3. Announcement and Notification

The system shall allow administrators to post announcements. The system shall notify users through in-system alerts and optional email

notifications.

4. Attendance Tracking and Monitoring

The system shall allow authorized users to record attendance per event. The system shall generate participation summaries and monitoring logs.

5. Donation and Distribution Management

The system shall allow recording of donation and distribution details. The system should provide summarized and organized donation records.

6. Report Generation

The system shall generate printable and exportable reports (e.g., PDF format).

7. Dashboard

The system shall display summarized data on events, attendance, and donations for quick monitoring and decision-making.

Requirements Documentation

This section presents the detailed requirements of the proposed system, defining its features, scope, and expected functionalities. It serves as a guide for system design and development, ensuring alignment between stakeholder needs and system capabilities.

The documentation establishes a clear understanding among stakeholders, minimizes miscommunication, and supports efficient project implementation. It also ensures that the system maintains quality, usability, and performance standards throughout the development process.

Design of Software, System, Product, and/or Processes

The system design outlines the overall structure, architecture, and workflow of the platform. It includes the development of data models, process flows, and interface designs to ensure efficient system functionality.

Core processes such as event scheduling, announcement dissemination, attendance tracking, donation management, and report generation are structured to ensure seamless interaction between system components. The design also incorporates appropriate technologies and frameworks to support system performance, scalability, and security.

Context Flow Diagram (CFD)

The Context Flow Diagram illustrates the interaction between the system and its four external users: LGU/Barangay Admin, Imam/Mosque Administrator, Community Leader, and Community Viewer. Each user provides specific inputs such as event details, announcements, attendance records, and donation data, while the system processes and returns outputs including schedules, notifications, reports, and updates. This diagram highlights the overall flow of information and the system's role in centralizing Ramadan program management.

Figure 2. Context Flow Diagram

Level 1 Data Flow Diagram (DFD)

The Level 1 Data Flow Diagram presents the major system processes, including user management, event scheduling, announcement and notification handling, activity monitoring, donation recording, and report generation. It illustrates how data flows between users and system databases, ensuring efficient processing, storage, and retrieval of information necessary for coordinated program management.

Figure 3. Level 1 Data Flow Diagram

Use Case Diagram

The Use Case Diagram represents the interactions between system users and the core functionalities of the system. Each user role—LGU/Barangay Admin, Imam/Mosque Administrator, Community Leader, and Community Viewer—performs specific actions such as managing schedules, posting announcements, recording attendance, and viewing program information. The diagram highlights the system's role in supporting organized, role-based operations.

Figure 4. Use Case Diagram

Flowchart

The flowchart illustrates the process of managing a Ramadan community activity within the system. It begins with user authentication, followed by event creation and submission by an authorized user. The LGU/Barangay Admin reviews and approves the event, after which it becomes visible to all users. Notifications are then disseminated through the system.

During the event, attendance is recorded and the event status is updated accordingly. After completion, donation and distribution data are logged, and the system generates a summary report. This process demonstrates the end-to-end workflow from event creation to documentation.

Figure 5. Flowchart

The flowchart illustrates the step-by-step process of how a Ramadan community activity is created, managed, and documented through the Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division. system. The process begins when an authorized user logs in and creates a new event or activity with complete schedule details. The Barangay Admin reviews and approves the submitted event, after which it is published and visible to all users. Community members are notified of the new event through the system's announcement and notification module. As the event progresses, authorized users record attendance and update event status. After the event is completed, donation and distribution data are logged

if applicable, and the system generates a post-event summary report. Overall, the flowchart presents the complete program management workflow from event creation to completion and documentation.

Tools and Technologies

Standardized diagramming tools were utilized in the development of Data Flow Diagrams (DFDs) and Context Flow Diagrams (CFDs) to ensure clear, consistent, and accurate visualization of system processes. The development of Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division. employs modern web development technologies, secure database management systems, and structured notification tools to ensure efficient, reliable, and scalable system performance. These tools and technologies were selected to support the system's functionality, improve user experience, and maintain data security and integrity throughout the Ramadan season program period.

Development

The proponents adopted a Kanban-based development approach to manage the system's progress efficiently. A Kanban board consisting of the columns 'To Do,' 'In Progress,' and 'Completed' was utilized to organize and monitor all development tasks. Tasks are moved to 'In Progress' once work begins and transferred to 'Completed' upon completion, allowing the team to effectively track workflow and project progress. Regular reviews of the Kanban board were conducted to identify issues, adjust priorities, and improve productivity.

This approach ensures that all required tasks are properly organized and completed without omission during the development process. The proponents also assigned specific roles for documentation and system development to improve coordination, accountability, and efficiency within the team. In the initial phase, project objectives were established, and system diagrams such as Data Flow Diagrams (DFDs), Context Flow Diagrams (CFDs), and Use Case Diagrams were developed to guide the system's structure and functionality.

The system modules were designed to support the four main user roles: Barangay Admin,

Imam, Community Leader, and Community Viewer, with clearly defined functions for each.

The system's user interface is developed using Visual Studio Code, while MySQL is used for database management and data storage, providing a reliable, secure, and structured backend for the system.

Overall, the Agile-Kanban methodology supports the development process by combining Agile principles with visual task management. This approach promotes flexibility, continuous improvement, and effective collaboration throughout the development of Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division. A Web- Based Scheduling, Notification, and Activity Monitoring System for Ramadan Season Programs in General Santos City.

TITLE OF THE STUDY:

Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division

I. Informant Profile

Name (Optional/Alas): _____

Position/Role: _____

Organization/Barangay: _____

Gender: _____

II. Organization / Community Program Overview

1. What is your role in organizing or managing Ramadan community activities?

2. How many Ramadan-related events does your organization/barangay typically conduct?

3. What types of activities are usually conducted? (e.g., Iftar, Taraweeh, charity drives, announcements)

4. How are these activities currently planned and coordinated?

III. Current Practices and Challenges

5. What methods do you currently use for scheduling events? (e.g., paper-based, social media, messaging apps)

6. How do you announce or inform the community about events?

7. How do you currently track attendance during events?

8. How are donations and distributions recorded?

9. What are the major challenges you experience in managing Ramadan programs?

IV. System Needs and Improvement

10. What problems do you want a system to solve in managing events?

11. What features do you think are most important in a system?

12. How important is a centralized system for managing schedules and announcements?

☐ Very Important ☐ Important ☐ Not Important

13. What improvements do you expect from a web-based system?

SURVEY QUESTIONNAIRE

Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division (MCAD)

I. RESPONDENT INFORMATION

Name: _____
Position/Role: _____
Office/Organization: _____
Years of Service: _____
Date: _____

II. INSTRUCTIONS

Good day!

We, the researchers, are currently conducting a study entitled "**Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division (MCAD)**". In line with this, we respectfully request your participation in answering the following questions. Your responses will be used solely for academic purposes and will greatly help in improving the proposed system.

Rest assured that all information gathered will be treated with confidentiality.

III. INTERVIEW / QUESTIONNAIRE PROPER

1. Are you knowledgeable about management system that can build transparency to other community?
2. Do you have currently appointment system, if not what are your suggestions if we we're able to make in the future?
3. Are their limitations about your service in the community that can help us in the future to avoid certain problems or challenges?
4. What are the specific services offered in MCAD that it's priority can help muslim communities makes their lives easier and efficient in their daily challenges?
5. It is complex enough for you if we make an appointment system that can help automate community on the services you offer in MCAD?
6. Does our system have an impact to the community catered by MCAD?
7. Any suggestions/recommendation about our current system?

APPENDIX C.
RESEARCH RESPONDENT / PARTICIPANT FORM

RESEARCH RESPONDENT/ PARTICIPANT CONSENT FORM

TITLE OF THE STUDY:

Web-Based Event Management System with Community Forum for City Mayor's Office Muslim Concerns and Affairs Division

RESEARCHERS:

Ashley Jan M. Aso
John Carlos Kozel A. Carcellar
Neil Amos C. Cloa
Josh Angelu Seanville L. Reyes

School: STI College- Gen. Santos, Inc.
Contact No: 09566686387
E-mail address: aashleyjanaso2002@gmail.com

You are being invited to be a part of this endeavor because you fit the inclusion criteria for a respondent/participant of this study.

Please take as much time as you need to read the consent form. If you decide to participate, you will be asked to sign and will be given a copy of this form.

PURPOSE OF THE STUDY

This study aims to develop a web-based event management system with a community forum for the City Mayor's Office Muslim Concerns and Affairs Division. The system is designed to improve the scheduling, coordination, communication, and documentation of Ramadan-related community programs, ensuring efficient and centralized management among barangay officials, imams, community leaders, and residents.

STUDY PROCEDURES

If you volunteer to participate in this study, if you agree to participate in this study, you will be requested to complete a survey questionnaire, participate in an interview, and/or join a focus group discussion (FGD). The data collection process is expected to be completed within 30 to 45 minutes.

POTENTIAL BENEFITS TO PARTICIPANTS AND/OR TO SOCIETY

This study aims to provide practical insights for barangay officials, imams, and community leaders in improving the management of Ramadan programs. The findings may serve as a basis for enhancing coordination, communication, and transparency in community activities through the use of a centralized digital platform.

Furthermore, this research contributes to the development of web-based systems for community program management, supporting more efficient service delivery, improved documentation, and increased stakeholder engagement within the local context.

CONFIDENTIALITY

We will keep your records for this study confidential as far as permitted by law. Any identifiable information obtained in connection with this study will remain confidential, except if necessary to protect your rights or welfare.

PARTICIPATION AND WITHDRAWAL

Your participation is voluntary. Your refusal to participate will involve no penalty or loss of benefits to which you are otherwise entitled.

RIGHTS OF RESEARCH PARTICIPANT

If you have questions, concerns, or complaints about your right as a research participant or the research in general and are unable to contact the researcher, or if you want to talk to someone independent of the researcher, please contact 09566686387 through the institutional email benhar.masahod@gensan.sti.edu.ph.

Certificate of Consent

I have read the information provided above. I have been given a chance to ask questions. My questions have been answered to my satisfaction. To wit:

- ☒ I fully understand the nature and purpose of this research.
- ☒ I give my voluntary consent to participate in this research.
- ☒ I indicate my contact details in case of a follow-up interview.

Contact No.: 0956-1222510

Research Coordinator

Note to Researchers:

Bring the following files for instrument validation:

- ☐ Approved Research Proposal
- ☐ Cover Letter addressed to the institution of the respondents/ informant/ participant.
- ☐ Research Respondent/ Participant Consent Form
- ☐ Copy of the Instrument
- ☐ Validation Tool with Certification

INSTRUMENT VALIDATION RESULT

ACD-CAPDGT_2026-001

INSTRUMENT VALIDATION TOOL

Directions: To establish the instrument's validity, you are requested to indicate the number that reflects your rating. When needed, you may write comments and suggestions to improve its validity.

SCALE	DESCRIPTION	INTERPRETATION
4	Valid	The questionnaire is valid. It provides unbiased data. Allowing 0-10% error.
3	Moderately Valid	The questionnaire is moderately valid. It provides unbiased data, allowing 11-15% error.
2	Less Valid	The questionnaire is less valid. It provides unbiased data, allowing 16-20% error.
1	Not Valid	The questionnaire is not valid. It provides biased data, allowing 21% or more errors.

CRITERIA	Expert's Rating and Remarks
1. Appropriateness of Scale. The scale of the instrument is appropriate for measuring each item.	
2. Suitability of Items. The concepts, vocabulary, and structure are suitable to the respondents' level.	
3. Relevance of Items. The instrument has items appropriate to the study's variables that can measure what it intends to measure.	
4. Clarity of Direction. The direction or content of the instrument is easy to understand.	
5. Adequateness of Items. The number of items is adequate to represent the coverage of the research or study.	
6. Organization. The items are framed and organized logically.	
7. Objectivity. The instrument can gather factual data that is free from biases and subjectivity.	
8. Comprehensiveness. The instrument can generate comprehensive information within the given time frame.	
9. Data Generation. The instrument can be used to generate data that are essential to research data analysis.	
10. Attainment of Purpose. In general, the instrument serves the purpose for which it is constructed.	
Grand Mean Rating / Validity Level:	

APPENDIX D.
CERTIFICATE TO CONDUCT A SURVEY

04/21/2028

Ms. Jocelyn L. Kanda
Community Affairs Officer IV
Muslim Concerns and Affairs Division
ICC Building Matalam Street Oval Plaza General Santos City

Dear Ma'am,

Mabuhay!

The undersigned is currently working on research titled "*Web-Based Event Management System with Community Forum For City Mayor's Office Muslim Concerns and Affairs Division (MCAD)*". This study aims to gather data related to the Our study focuses on improving the management of Ramadan season programs in General Santos City, where activities are often handled through manual scheduling and informal announcements. These methods can cause delays, conflicts, and poor monitoring of events and donations. To address this, we developed a Web-Based Event Management System with Community Forum to provide centralized scheduling, communication, and activity tracking.

The result of this study will Conducting this study can help improve the organization and coordination of Ramadan programs by providing a centralized system for scheduling events, sharing announcements, and monitoring activities. It can also enhance transparency in donation and resource tracking, making it easier for barangay officials and community leaders to manage programs efficiently. In the long term, the study may serve as a useful model for other communities seeking better digital solutions for event management and public coordination.

In connection with this, we would like to ask your permission and endorsement to allow us to conduct survey/interview the Barangay staff, Muslim community leaders, Imams or mosque administrators, and selected community members in General Santos City Rest assured that whatever data will be gathered from this study will be treated with utmost confidentiality.

I am hoping for your favorable response to this undertaking.

Respectfully yours,
THE PROPONENTS:

APPENDIX E.
TRANSCRIPTION

We are also limited by time, if it is beyond office hours, we cannot accommodate them anymore. Also, sensitive information cannot be posted or shared publicly.

10 **4. What are the specific services offered in MCAD that it's priority can help Muslim communities makes their lives easier and efficient in their daily challenges?**

11 **PARTICIPANT 1:** Based on the system, I believe that the services that focus on event scheduling and organizing community programs are very helpful. Having a platform where events are recorded and accessible can make coordination easier for the Muslim community, especially for upcoming activities.

12 **PARTICIPANT 2:** We offer settlement under Shariah, under the Muslim Code. We also cater marriage contracts and certificates of marriage. We assist in conversion to Islam, especially for Christians who revert to Islam. We handle various concerns of the Muslim community in General Santos. One of our major services is providing shroud or burial cloth. If a Muslim dies in the hospital, we arrange for a driver to pick up the body and bring it to their home. This is important because burial must happen within 24 hours. We also handle conflict resolution under Shariah at Katarungan, where parties involved seek help to settle disputes instead of going to court. We assist clients who need certification for burial assistance, certification of death, and certificates of good moral character for PRC exams. We also provide certificates of Balik Islam and assist clients in registering them in the Sharia Court. In addition, we help clients register marriages in the Sharia Court, especially those who were previously married without documentation.

13 **5. It is complex enough for you if we make an appointment system that can help automate community on the services you offer in MCAD?**

14 **PARTICIPANT 1:** For me, the system is not too complex because I already understand how to use it, especially after it was demonstrated. I think it is manageable and user-friendly as long as users are guided properly. I also believe it is safe to use because it has privacy features.

15 **PARTICIPANT 2:** No, it would not be too complex. We can add it to our system, but it would require approval from the division chief, especially for sensitive information. It is important that we know how it will improve and speed up our services. It would be better if clients can input their details online so it is faster and more convenient for our staff. That way, staff will not need to type everything manually anymore, they can just print the documents.

16 **6. Does our system have an impact to the community catered by MCAD?**

17 **PARTICIPANT 1:** Yes, I believe the system can have a positive impact on the Muslim community. It is effective because it allows us to create events and share them with others, making it easier for community members to access information. If the system remains accessible in the future, it will still be useful since events are recorded and will not easily be lost.

18 **PARTICIPANT 2:** Yes, if your system is implemented, it will have a big impact on the community. Clients can be arranged through a numbering system, making the process more organized. For example, even clients who are abroad will not need to come home, they can process things online. All things considered, it will make the system more organized and reduce complaints.

Interview Transcription (SAMPLE)

Transcription of Participants Responses on the One-on-one Interview

Participant 1: April 23, 2026

Participant 2: April 30, 2026

1 **1. Are you knowledgeable about management system that can build transparency to other community?**

2 **PARTICIPANT 1:** Yes, I am knowledgeable about management systems. Based on what I have seen in your system, I think it can build transparency in the community because it allows people to create events and make them visible to others. Through this, the community can easily access information about upcoming programs and activities.

3 **PARTICIPANT 2:** No, I am not knowledgeable about a management system that can build transparency to other communities because we do not have a system in our office. Here in MCAD, our management system for services is more on manual. There is not much technology involved yet, and it is not integrated into information technology.

4 **2. Do you have currently appointment system, if not what are your suggestions if we're able to make in the future?**

5 **PARTICIPANT 1:** As of now, I do not have an appointment system that I use for the community. If you will create one in the future, I suggest that you focus on how the system will be introduced to the Muslim community. Not all community members are aware of such systems, so proper introduction and explanation will help increase usage.

6 **PARTICIPANT 2:** We do not have an appointment system in our office. Usually, clients just send private messages through PM, but there is no proper system for tracking or recap. We also do not have a numbering system in place. If we were to have one in the future, it would be better if every client is assigned a number. A numbering system, like in clinics, would help prevent cutting in line. It would also be good if there is an online system where clients can set appointments. Also, having time slots like in PSA would make the process more organized.

7 **3. Are their limitations about your service in the community that can help us in the future to avoid certain problems or challenges?**

8 **PARTICIPANT 1:** One limitation that I can see is accessibility, especially for elderly community members. Many of them are the ones organizing events, but they may not easily understand or access the system. This may become a challenge if the system is not introduced properly or if the system is not easy for them to use.

9 **PARTICIPANT 2:** Yes, there are limitations in our services. If clients open very personal problems, we limit our involvement. If they are not endorsed by the barangay, we cannot fully accommodate them. Another limitation is when clients cannot send a PM.

19 **7. Any suggestions/recommendation about our current system?**

20 **PARTICIPANT 1:** My recommendation is to improve how the system will be introduced and promoted to the Muslim community. Since not everyone is aware of the system, it is important to explain clearly how it works and how it can be accessed. This is especially important for elderly members, because they are often the ones managing events. In addition, including donation features is also a good idea because it is appropriate and the intention is good, so I see no problem with it.

21 **PARTICIPANT 2:** It would be better if clients can input their details online so it is faster and more convenient for staff. For conflict resolution, having an online complaint form would help speed up scheduling and prioritization. Staff can immediately see which cases are urgent. A numbering system, like in clinics, would prevent singitan. Time slots like in PSA would also help organize appointments better. If clients can submit details in advance, then when they arrive, everything is already prepared and they can get their documents in less than 5 minutes. We can also add this system on our end if approved.

IV. System Needs and Improvement

10. What problems do you want a system to solve in managing events?

Confirmation of their attendance in RVP

11. What features do you think are most important in a system?

Accessibility to all

12. How important is a centralized system for managing schedules and announcements?

Attendance of participants, information dissemination

☒ Very Important ☐ Important ☐ Not Important

13. What improvements do you expect from a web-based system?

Accessibility to all, regularly to the scheduled who are all continuously updated to those participants in far flung areas without connectivity / internet access

V. Technology and System Features
Core Features of the Proposed System

VI. Final Feedback

14. Do you think this system will improve coordination in your community? Why?

Yes, easy access to all possible participants

15. What suggestions can you give to improve the proposed system?

Let to the administrator, only access to clearly

Feature	Does your current system have this? (YES/NO)	Challenges encountered	How should the system improve it?
Event Scheduling (calendar, event details)			
Announcement & Notification			
Attendance Tracking			
Donation Distribution Recording
